**Closed or Downwind turn**

When remaining in the circuit a closed or a downwind turn may be requested. A closed implies a climbing turn to downwind when passing the departure end of the runway. A downwind turn implies a turn to downwind when reaching circuit altitude.

Initial straight-in approach

From initial, a straight-in approach can be made. A one-minute prior initial, or abeam initial, shall be reported in order to sequence potential traffic in the circuit. A descent to 1000 ft AMSL will be initiated from the one-minute prior or abeam initial call towards initial.

Direct Downwind

From VFR entry points a direct path to downwind. A one-minute prior downwind shall be reported in order to sequencing potential traffic in the circuit. The descent to circuit altitude will be initiated from the one-minute prior call towards downwind.

Civil pattern

From VFR entry points, a direct path to downwind. Downwind will be entered at 700 ft AMSL.

Simulated Flame Out (SFO) specially for PC-7

High key will start at 2500 ft AMSL. The SFO pattern is standard in the north, however a pattern to the south may be applied to assure an expeditious flow of the potential traffic in the circuit.

LOW APPROACH, TOUCH AND GO, GO-AROUND.

After a Low Approach, Touch and Go or Go-around, traffic is to stop the climb at 1000 ft until passing airfield boundary at runway end.

SLOW LANE PROCEDURES

The slow-lane is standard on the northern side of the runway or otherwise instructed by ATC. Crossing the fast-lane is only allowed after permission from TWR. The slow lane is also to be used for dropping the drag chute.

EHWO AD 2.23 Additional information**VFR Lost communications procedure (EMVO only)**

1. Proceed VFR towards the airfield, stay clear of centerline and try to contact Woensdrecht tower. If no radio contact can be established, squawk 7600 and execute a VFR non radio procedure:
2. Squawk 7600.
3. If outside the CTR, follow the standard recovery procedures to one of the VFR entry points.
4. If the pilot assumes that there could be a change to the latest known runway-in-use: proceed from the north at altitude 2500 ft AMSL overhead the field and determine the runway-in-use. Turn in the direction of traffic to the dead side of the runway-in-use and descent to altitude 2000 ft AMSL. Fly via outer downwind to initial.
5. From Initial Point descent to altitude 500 ft AMSL at the dead side of the runway-in-use to pass in front of the tower while rocking the aircrafts wings.
6. At the end of the runway start a climbing turn to join downwind.
7. On downwind expect a light signal from tower. Acknowledge the light signal by rocking the aircrafts wings.
8. Expect another light signal at base-leg. Do not acknowledge the light signal.
9. In case of a flashing red light signal from tower or initiating a go-around, return to downwind (not before the end of the runway). After landing taxi back to dispersal following the standard procedures.

Large air traffic Limitations

Due to protected nature reserve (Markiezaat) situated just north-west of the airbase, a restriction has been established to all aircraft with a wingspan > 30m. At all times this area must be avoided below 3000 ft. A map of the corresponding boundaries of this area is shown below.

Determination of datum line for intersection take-off

The datum line from which the reduced runway declared distances for take-off should be determined, is defined by the intersection of the downwind edge of the specific taxiway with the runway edge as shown in the diagram below. The loss of runway length due to alignment of the aircraft prior to take-off should be taken in account by the operators for the calculation of the aircraft's take-off mass (ICAO Annex 6, Part 1, paragraph 5.2.8)

Separation between TWY A3 and A4

*The designation change between TWY A3 and A4 is at the western edge of the junction with Taxiway AR. There is no physical marking.
